Simultaneous Tomographic Image Reconstruction and Motion Estimation

Felix Lucka

UGCT Seminar
22 February 2021

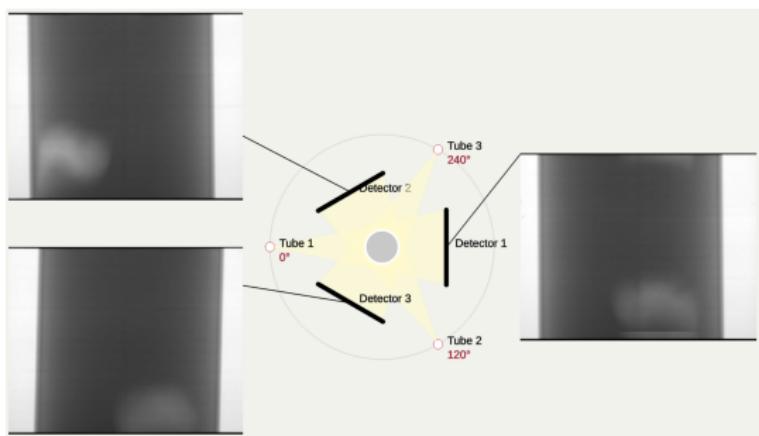

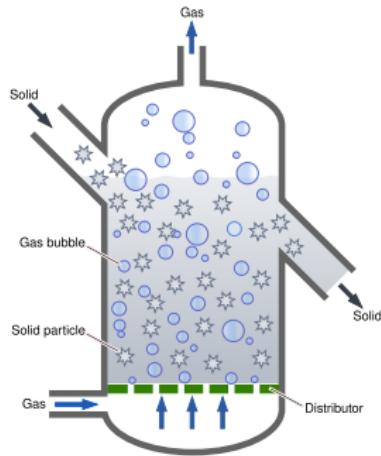

Example: In Vivo Time-Resolved Microtomography

Walker, Schwyn, Mokso, Wicklein, Müller, 2014. In Vivo Time-Resolved Microtomography Reveals the Mechanics of the Blowfly Flight Motor, *PLoS Biol* 12(3).

Example: Fluidized Bed Reactors

Collaboration with the Transport Phenomena group at TU Delft.

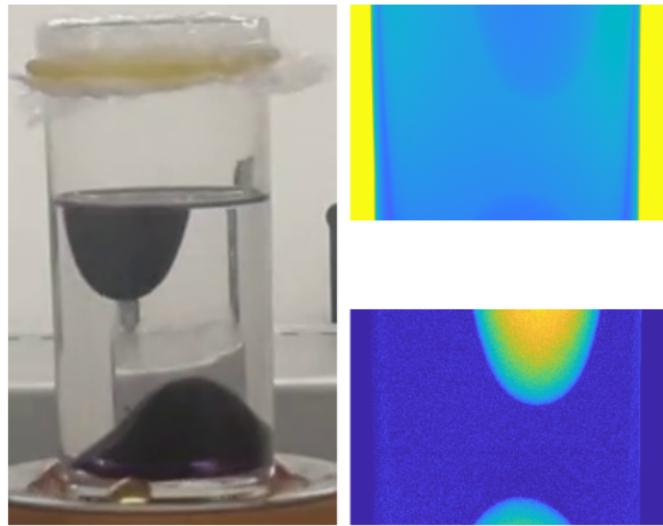

Own Experiments: Two-Phase Flow Instability

- canonical example of temperature-driven **two-phase flow instability**
- 120 projections per rotation → each projection averaged over 3°
- 40ms exposure per projection → 4.8s per rotation

Own Experiments: Two-Phase Flow Instability

- canonical example of temperature-driven **two-phase flow instability**
- 120 projections per rotation → each projection averaged over 3°
- 40ms exposure per projection → 4.8s per rotation

Overview Dynamic Imaging

Applications

- scientific, industrial and clinical
- vast range of dynamics (rigid motion, elastic deformation, fluid dynamics, crack formation, chemical kinetics, granular flows, ...)

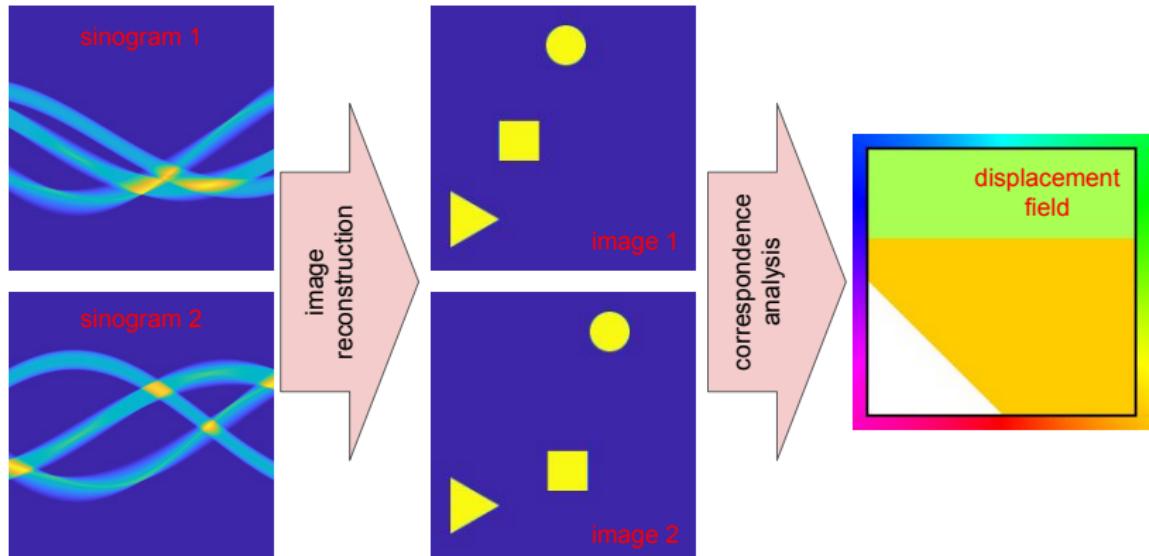

Goals

- motion compensation
- full dynamic reconstruction (+ simultaneous motion estimation?)
- retrospective / real time / prediction
- parameter identification in dynamical systems

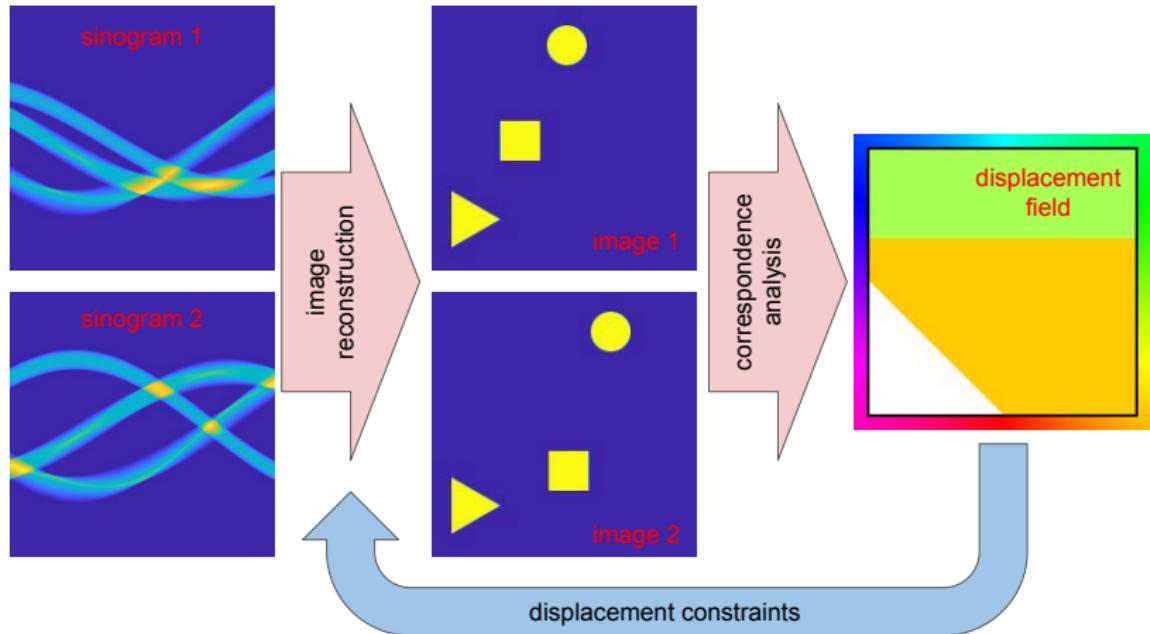

Challenges

- no high quality frame-by-frame reconstruction possible (motion artefacts, no gating, noise, low angular res,...)
- mathematical modeling of dynamics
- computational image reconstruction

Sequential Image Reconstruction and Correspondence Analysis

Alternating Image Reconstruction and Correspondence Analysis

Overview Mathematical Setup and Challenges

static

$$f = Au^\dagger$$

dynamic

$$f(t) = C(t)Au^\dagger(t)$$

binned

$$\begin{bmatrix} f(t_i) \\ \vdots \\ f(t_j) \end{bmatrix} = \begin{bmatrix} C(t_i) \\ \vdots \\ C(t_j) \end{bmatrix} Au_{ij}$$

✓ static reconstruction of sufficient quality

! $C(t)$ reduces dimension of data

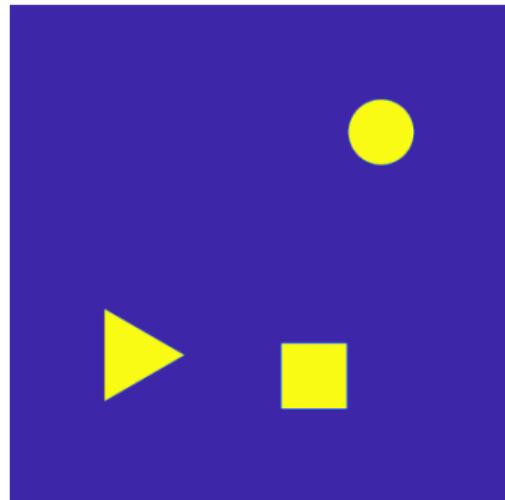

! trade-off:

- larger bins → more motion-blur
- smaller bins → more underdetermined (limited-angle)

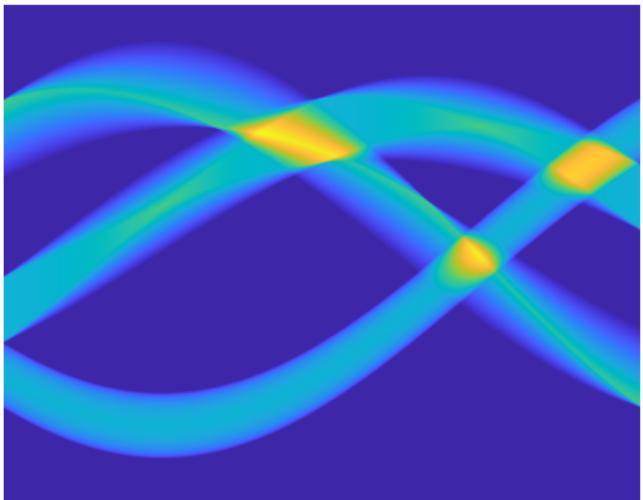

! sequential scanning is worst sub-sampling (\neq "compressed sensing")

! high computational/memory demands

Variational Space-Time Decomposition

Implicit spatio-temporal decomposition via **infimal convolutions**:

$$\hat{u} = \operatorname{argmin}_{u \geq 0, w} \frac{1}{2} \sum_i \|C_i A u_i - f_i\|_2^2 + \alpha TV_{\beta_1}(u - w) + \gamma TV_{\beta_2}(w)$$

-  **Holler, Kunisch, 2014.** On infimal convolution of TV type functionals and applications to video and image reconstruction, *SIAM IS*.
-  **Schloegl, Holler, Schwarzl, Bredies, Stollberger, 2017.** Infimal Convolution of Total Generalized Variation Functionals for Dynamic MRI, *MAGN*.

Explicit decomposition of Casorati matrix via **low-rank + sparsity** models:

$$\hat{u} = \operatorname{argmin}_{U_L, U_S} \frac{1}{2} \|A(U_L + U_S) - F\|_2^2 + \alpha_L \|LU_L\|_* + \alpha_S \|SU_S\|_1$$

-  **Ravishankar, Ye, Fessler, 2019.** Image Reconstruction: From Sparsity to Data-adaptive Methods and Machine Learning, *arXiv:1904.02816*.

Lava Lamp: Frame-by-Frame Reconstruction

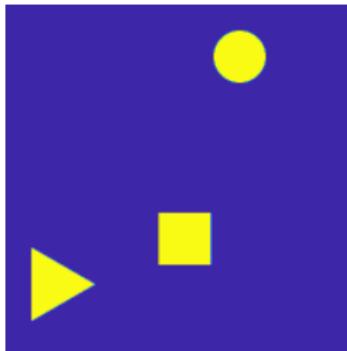

Sequential Image Reconstruction and Correspondence Analysis

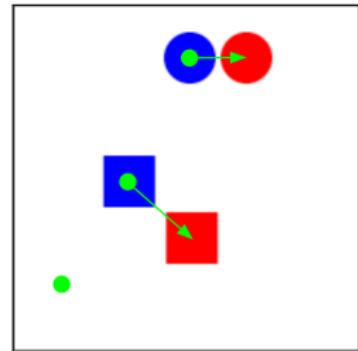

Correspondence Problems

u_1

u_2

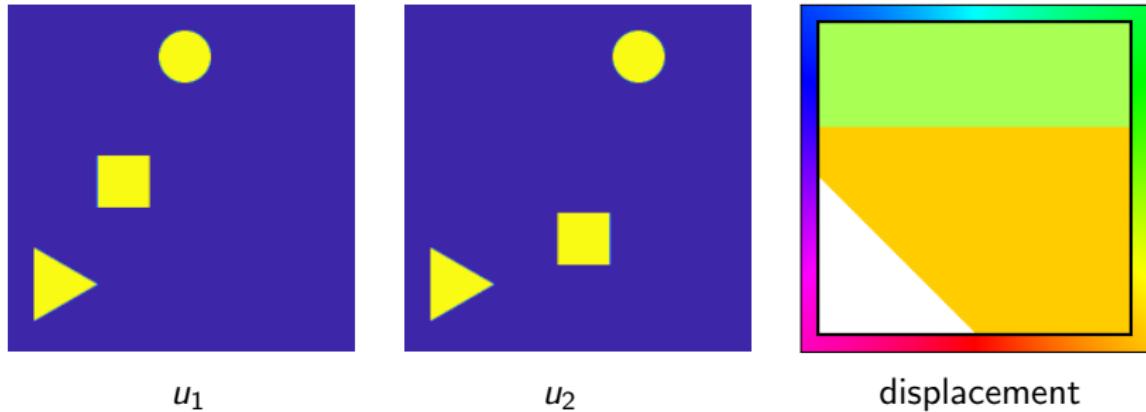

$u_2 - u_1$

search for correspondences in images taken at different times, from different perspectives and/or with different sensors

- tracking, optical flow, stereo vision, deformation
- computer vision, medical imaging, fluid dynamics
- "displacement / motion / deformation / flow / ..."

Methods: correlation based, descriptor/patch based, variational, deep learning, sparse vs. dense

Correspondence Problems

search for correspondences in images taken at different times, from different perspectives and/or with different sensors

- tracking, optical flow, stereo vision, deformation, ...
- computer vision, medical imaging, fluid dynamics, ...
- "displacement / motion / deformation / flow / ..."

Methods: correlation based, descriptor/patch based, variational, deep learning, sparse vs. dense

Illustration: Non-Uniqueness

Illustration: Non-Uniqueness

$$u_2(x + v(x)) = u_1(x)$$

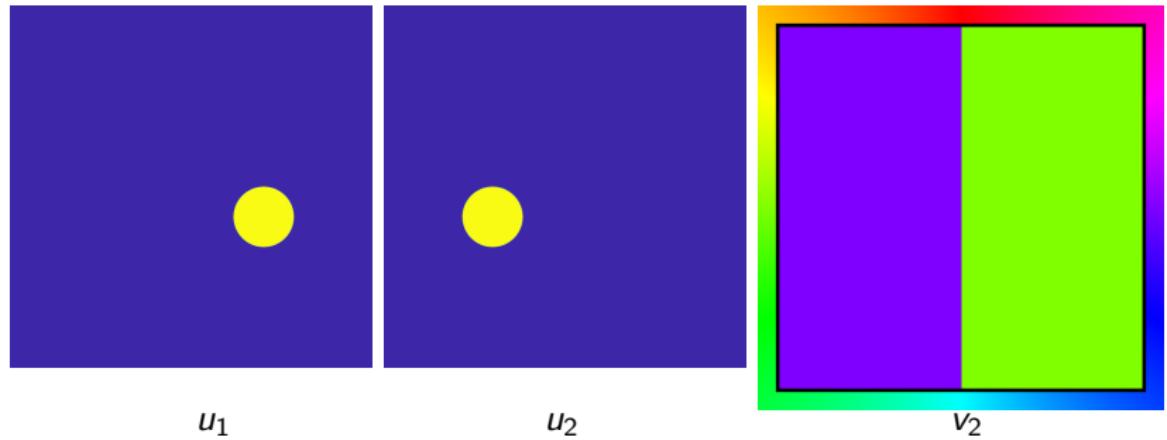

Illustration: Non-Uniqueness

$$u_2(x + v(x)) = u_1(x)$$

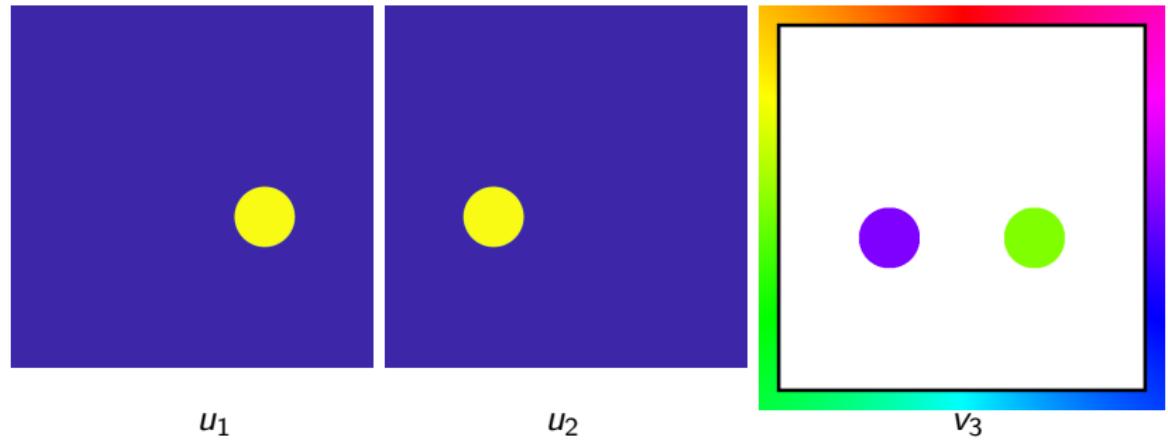

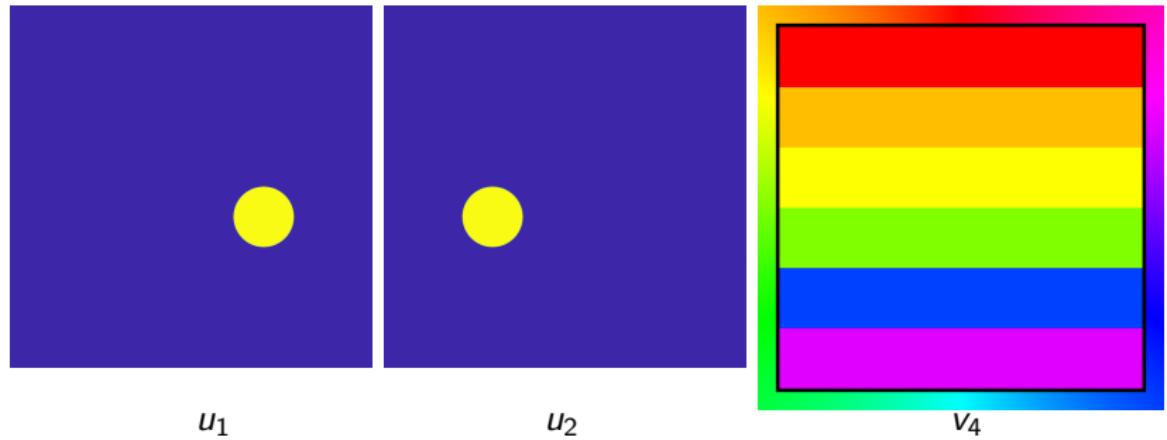

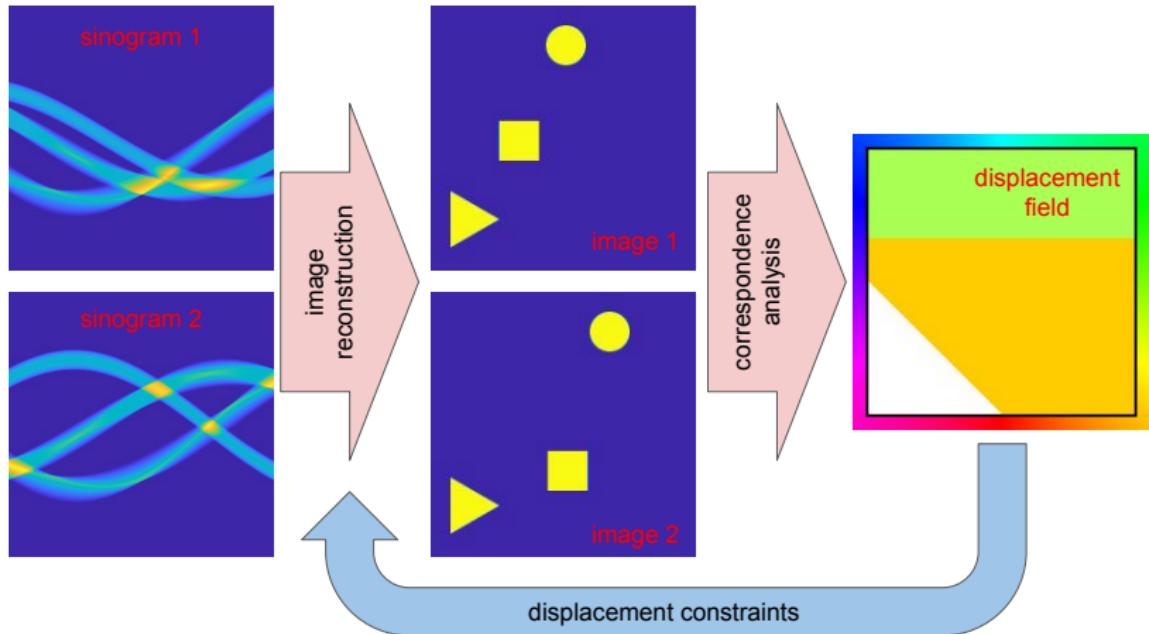

Illustration: Non-Uniqueness

$$u_2(x + v(x)) = u_1(x)$$

Alternating Image Reconstruction and Correspondence Analysis

Simultaneous Image Reconstruction and Motion Estimation

$$\min_{u,v} \left(\mathcal{E}(u,v) = \frac{1}{2} \sum_{i=1} \|C_i A u_i - f_i\|_2^2 + \alpha \mathcal{R}(u_i) + \beta \mathcal{H}(v_i) + \gamma \mathcal{M}(u,v) \right)$$

$$\mathcal{M}(u,v) := \sum_i \frac{1}{p} \|u_{i+1}(x + v_i(x)) - u_i(x)\|_p^p$$

- $\mathcal{R}(u_i)$, $\mathcal{H}(v_i)$ typically **convex but non-smooth**, e.g., TV
- $\mathcal{E}(u,v)$ convex in u
- $\mathcal{M}_p'(u,v)$ convex in $v \implies \mathcal{E}(u,v)$ **bi-convex** in (u,v)

alternating optimization:

$$u^{k+1} = \operatorname{argmin}_u \mathcal{E}(u, v^k) \quad \text{image estimation, convex, non-smooth}$$

$$v^{k+1} = \operatorname{argmin}_v \mathcal{E}(u^{k+1}, v) \quad \text{motion estimation, (non-)convex, non-smooth}$$

linear

non-linear

Summary

- dynamic imaging is **hard in both theory and practice**
- **trade-off** between spatial and temporal resolution
- motion estimation (correspondence problem) is tough
- sequential scanning is the worst
- simultaneous image reconstruction and motion estimation
- spatio-temporal regularization via **hidden variable models**
- heavy numerical optimization

-  **L, Coban, Grass, Lagerwerf, Der Sarkissian, Palenstijn, Batenburg, 202?.** Dynamic Tomography of Rapid Deformations with Sequential Scanning, *in preparation*.
-  **L, Huynh, Betcke, Zhang, Beard, Cox, Arridge, 2018.** Enhancing Compressed Sensing Photoacoustic Tomography by Simultaneous Motion Estimation, *SIAM Imaging Sciences 11 (4)*.

Continuous Derivation

Assume intensity $u(x, t)$ constant along $x(t)$ with $\frac{dx}{dt} = \tilde{v}(x, t)$ (velocity):

$$0 = \frac{d}{dt} u(x(t), t) = \frac{\partial u}{\partial t} + \sum_{k=1}^d \frac{\partial u}{\partial x_k} \frac{\partial x_k}{\partial t} = \partial_t u + (\nabla u) \cdot \tilde{v}$$

↔ continuity PDE.

Given $u_1(x) := u(x, t_1)$, $u_2(x) := u(x, t_2)$
net displacement/motion field

$$v(x) = \int_{t_1}^{t_2} q(t) dt, \quad \text{where } q(t) \text{ solves } \frac{d}{dt} q(t) = \tilde{v}(q(t), t), \quad q(t_1) = x$$

optical flow equation:

$$u_2(x + v(x)) = u_1(x) \quad ! \text{ underdetermined !}$$

Variational Motion Estimation

regularized motion estimation

$$\min_v \mathcal{H}(v) \quad \text{such that} \quad u_2(x + v(x)) = u_1(x)$$

$$\min_v \frac{1}{p} \|u_2(x + v(x)) - u_1(x)\|_p^p + \beta \mathcal{H}(v) \quad ! \text{ terribly non-convex !}$$

Variational Motion Estimation

regularized motion estimation

$$\min_v \mathcal{H}(v) \quad \text{such that} \quad u_2(x + v(x)) = u_1(x)$$

$$\min_v \frac{1}{p} \|u_2(x + v(x)) - u_1(x)\|_p^p + \beta \mathcal{H}(v) \quad ! \text{ terribly non-convex !}$$

small displacements around $\bar{v}(x)$:

$$u_2(x + v(x)) \approx \bar{u}_2(x) + (\nabla \bar{u}_2(x)) \cdot (v(x) - \bar{v}(x))$$

$$\bar{u}_2(x) := u_2(x + \bar{v}(x)) =: \mathcal{W}_{\bar{v}} u_2 \quad (\text{warping})$$

$$\min_v \frac{1}{p} \|\bar{u}_2 - (\nabla \bar{u}_2) \cdot \bar{v} - u_1 + (\nabla \bar{u}_2) \cdot v\|_p^p + \beta \mathcal{H}(v)$$

for $\bar{v} = 0$ we get to backward-discretized PDE back:

$$\min_v \frac{1}{p} \|u_2 - u_1 + (\nabla u_2) \cdot v\|_p^p + \beta \mathcal{H}(v)$$

Computational Solution I

linearized problems:

$$\min_v \frac{1}{p} \|a \cdot v - f\|_p^p + \beta \mathcal{H}(v)$$

convex but typically non-smooth, e.g. $p = 1$, $\mathcal{H}(v) = TV(v)$

Primal-dual hybrid gradient: too slow convergence in 3D

Alternating directions method of multipliers (ADMM):

- ! more difficult to parameterize
- ! badly conditioned, large-scale least-squares problems
- ! choice of iterative solver crucial, here **AMG-CG**

Chambolle, Pock, 2016. An introduction to continuous optimization for imaging, *Acta Numerica*.

$$\min_v \frac{1}{p} \|u_2(x + v(x)) - u_1(x)\|_p^p + \beta \mathcal{H}(v)$$

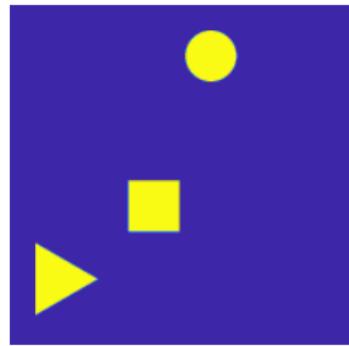

coarse-to-fine scheme:

- successive smoothing & down-sampling of u_2 , u_1
- successive solution of linearized problems on each level
- upsampling of solution and aux variables to finer level
- optional: add line search

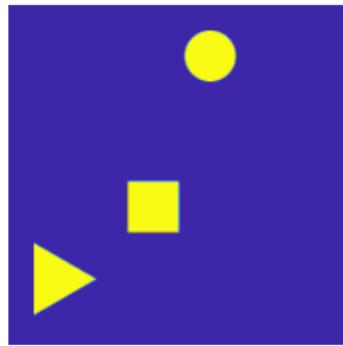

Brox, Bruhn, Papenberg, Weickert, 2004. High Accuracy Optical Flow Estimation Based on a Theory for Warping, *ECCV 2004*.
